- 4. A fan stage of a ducted gas turbine engine that is at least in part rotatable about an axis of rotation, comprising:
- a fan casing that defines an inner duct wall having a fan rotor region, the inner duct wall of the fan casing at the fan rotor region being convergent;
 - a hub disposed concentrically relative to the fan casing;
- a fan rotor that includes multiple swept fan blades, the swept fan blades being spaced apart around the hub, each of the multiple swept fan blades having:
- a tip profile that substantially corresponds to the convergent inner duct wall of the fan casing;
- a leading edge that defines a variable sweep angle in a direction perpendicular to the axis of rotation, the leading edge including:

an inner region adjacent the hub, the inner region defining a forward sweep angle;

an intermed ate region between the inner region and the fan casing, the intermediate region defining a rearward sweep angle; and

an outer region between the intermediate region and the fan casing, the outer region being translated forward.

5. A fan stage of a ducted gas turbine engine that is at least in part rotatable about an axis of rotation, comprising:

a fan casing that defines an inner duct wall having a fan rotor region, the inner duct wall of the fan casing at the fan rotor region being convergent;

a hub disposed concentrical/ly relative to the fan casing;

a fan rotor that includes multiple swept fan blades, the swept fan blades being spaced apart around the hub, each of the multiple swept fan blades having:

a tip profile that is convergent so as to substantially correspond to the convergent inner duct wall of the fan casing;

a leading edge that defines a variable sweep angle in a direction perpendicular to the axis of rotation, the leading edge including:

an inner region adjacent the hub, the inner region defining a forward sweep angle;

an intermediate region between the inner region and the fan casing, the intermediate region defining a rearward sweep angle; and

an outer region between the intermediate region and the fan casing, the outer region being translated forward.

6. A fan stage of a ducted gas thrbine engine that is at least in part rotatable about an axis of rotation, comprising:

a fan casing that defines an inner duct wall having a fan rotor region, the inner duct wall of the fan casing at the fan rotor region being convergent;

a hub disposed concentrically relative to the fan casing;

a fan rotor that includes multiple swept fan blades, the
swept fan blades being spaced apart around the hub, each of the
multiple swept fan blades having:

a tip profile that substantially corresponds to the convergent inner duct wall of the fan casing;

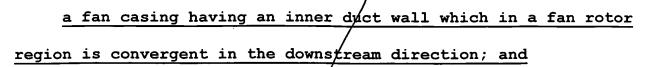

a leading edge that defines a variable sweep angle in a direction perpendicular to the axis of rotation, the leading edge including:

an inner region adjacent the hub, the inner region defining a forward sweep angle;

an intermediate region between the inner region and the fan casing, the intermediate region defining a rearward sweep angle; and

an outer region between the intermediate region and the fan casing, the outer region defining a forward sweep angle.

- 7. A fan stage of a ducted fan gas turbine engine, comprising:
- a fan casing having an inner duct wall which in a fan rotor region is convergent in the downstream direction; and
- a fan rotor including a multi/plicity of swept fan blades spaced apart around a hub mounted concentrically with respect to the fan duct, each of said swept fan blades having (i) a tip profile which in revolution substantially corresponds to the convergent duct wall, (ii) a leading edge of variable sweep angle which varies with | ncreasing blade height or distance from the axis of rotation, said sweep angle having a forward sweep angle in a first height \region between the root and a first intermediate radius, a #earward sweep angle in an intermediate height region between the first intermediate radius and a second intermediate radius, and a sweep angle in a third height region between the second intermediate radius and the tip of the blade such that said thir height region is translated forward, and (iii) a stagger angle which increases progressively with blade height.
- 8. A fan stage of a ducted fan gas turbine engine, comprising:

a fan rotor including a multiplicity of swept fan blades spaced apart around a hub mounted concentrically with respect to the fan duct, each of said swept fan blades having (i) a tip profile which in revolution/is convergent so as to substantially correspond to the convergent duct wall, (ii) a leading edge of variable sweep angle which varies with increasing blade height or distance from the axis of rotation, said sweep angle having a forward sweep angle in/a first height region between the root and a first intermediate fadius, a rearward sweep angle in an intermediate height fegion between the first intermediate radius and a second intermédiate radius, and a sweep angle in a third height region between the second intermediate radius and the tip of the blade such/that said third height region is translated forward, and (iii) a stagger angle which increases progressively with blade height.

9. A fan stage of a ducted fan gas turbine engine, comprising:

a fan casing having an inner duct wall which in a fan rotor region is convergent in the downstream direction; and

a fan rotor including a multiplicity of swept fan blades
spaced apart around a hub mounted concentrically with respect to
the fan duct, each of said swept fan blades having (i) a tip
profile which in revolution substantially corresponds to the
convergent duct wall, (ii) a leading edge of variable sweep angle
which varies with increasing blade height or distance from the
axis of rotation, said sweep angle having a forward sweep angle
in a first height region between the root and a first
intermediate radius a rearward sweep angle in an intermediate
height region between the first intermediate radius and a second
intermediate radius, and a forward sweep angle in a third height
region between the second intermediate radius and the tip of the
blade, and (iii) a stagger angle which increases progressively
with blade height.

10. A fan stage of a ducted fan gas turbine engine, comprising

a fan casing having an inner duct wall which in a fan rotor region is convergent in the downstream direction; and

a fan rotor including a multiplicity of swept fan blades
spaced apart around a hub mounted concentrically with respect to
the fan duct, each of said swept fan blades having a tip profile
which in revolution is convergent so as to substantially

correspond to the convergent duct wall, a leading edge of variable sweep angle which varies with increasing blade height or distance from the axis of rotation, said sweep angle having a forward sweep angle in a first height region between the root and a first intermediate radius, a rearward sweep angle in an intermediate height region between the first intermediate radius and a second intermediate radius, a forward sweep angle in a third height region between the second intermediate radius and the tip of the blade, a stagger angle which increases progressively with blade height.

- 11. A fan stage of a ducted fan gas turbine engine as

 claimed in claim 10 wherein the blade has a tip region of about

 24% of blade height characterized in that the stagger angle

 increases to less than 90° at the tip relative to the airflow

 direction.
- 12. A fan stage of a ducted fan gas turbine engine as claimed in claim 11 wherein in a blade tip region of about 24% of the height of the blade the sweep of the leading edge changes from rearward sweep to forward sweep.

(()

- 13. A fan stage of a ducted fan gas turbine engine as claimed in claim 11 wherein in a blade tip region of about 24% of the height of the blade the sweep of the leading edge decreases.
- 14. A fan stage of a ducted fan/gas turbine engine as claimed in claim 13 wherein the blade is further characterized in that the stagger angle of the mid-height region of the blade is a predetermined fraction of the stagger angle at the tip region.
- 15. A fan stage of a ducted fan gas turbine engine as claimed in claim 10 wherein the sweep angle of the leading edge of a swept fan blade at a point on the leading edge is less than the complement of the angle of a Mach cone at any other point on the leading edge of the blade at greater radius from the root.
- 16. A fan stage of a ducted fan gas turbine engine as claimed in claim 10 wherein the shape of the pressure surface of a swept fan blade and the suction surface thereof creates, in use, a line of minimum static pressure points on the suction surface of the blade, said line of minimum static pressure points is inclined with respect to the axial direction at a sweep angle which varies with span height of the blade, and has a negative value in a region of subsonic flow over the leading edge.

17. A fan stage of a ducted fan gas turbine engine as claimed in claim 1/6 wherein the sweep angle of the line of minimum pressure points at a point on the line is less than the complement of the angle of a Mach cone at any other point on the line.

- 18. A fan stage of a ducted gas turbine engine that is at least in part rotatable about an axis of rotation and defines a downstream direction along the axis of rotation, comprising:
- a fan casing that defines an inner duct wall having a fan rotor region, the inner duct wall of the fan casing at the fan rotor region being convergent;
 - a hub disposed concentrically relative to the fan casing;
- a fan rotor that includes multiple swept fan blades, the swept fan blades being spaced apart around the hub, each of the multiple swept fan blades having:
- a tip profile that is convergent so as to substantially correspond to the convergent inner duct wall of the fan casing;
- a leading edge that defines a variable sweep angle in a direction perpendicular to the axis of rotation, the leading edge including:

an inner region adjacent the hub, the inner region defining a forward sweep angle;

an intermediate region between the inner region and the fan casing, the intermediate region defining a rearward sweep angle; and

an outer region/between the intermediate region and the fan casing, the outer region defining a forward sweep angle.

- 19. The fan stage according to claim 18, wherein the intermediate region extends further than the inner region along the axis of rotation.
- 20. The fan stage according to claim 18, wherein the inner duct wall of the fan casing at the fan rotor region is substantially convergent in the downstream direction.
- 21. The fan stage according to claim 18, wherein the tip profile of the multiple swept fan blades are substantially convergent in the downstream direction.
- 22. The fan stage according to claim 18, wherein each of the multiple swept fan blades includes a hub contacting surface that extends further than the tip profile along the axis of rotation.
